Heat Signal - Peer Feedback Log

Student: Perumal Marimuthu
Prototype: NYC 311 Heat and Hot Water Requests, 2024 (Project name : Heat Signal)

Feedback from Ashik John: Ashik found that the full 264,750 record extract, four question driven views, and cross filtering were clear and easy to trust. He specifically noted that selecting Brooklyn updates the filter chip, KPI total, and monthly chart together. His main suggested improvement is the weekday hour heatmap: its teal to yellow to orange ramp uses multiple hues for ordered report counts, which can make mid range values harder to compare and less clear in greyscale or for colourblind viewers.

Planned final change: I will replace the heatmap with a single hue light to dark sequential ramp (for example, D3 interpolateOranges) so darker always means more reports. I will also add labelled legend values, such as 0, 5,000, and 10,000 requests, and check the result in greyscale before the final submission.

Feedback I gave to Ashik John: “Your linked filtering and encoding choices are clear; the biggest improvement before the final would be adding a short on screen data source and cleaning note, including the 1,338 records and derived BMI categories, so viewers can understand the dataset without opening the README.”
